Kenandy

Cloud ERP for Manufacturing

As a manufacturer you face a variety of business challenges in your operations, ranging from inventory management to production scheduling to managing your relationships with an increasingly global supply chain and customer base. Mastering these challenges—while at the same time constantly looking for ways to reduce production cost and increase profit margins —can be very overwhelming.

Kenandy Cloud ERP is designed to help manufacturers to manage their business better by providing MRP, inventory and warehouse management, trade promotions management, core financials and more—all in one system—natively build on the Salesforce platform. And because everything is built to work together with order-to-cash, supply chain management, and manufacturing—your operations are in sync all the time.

Maximize the Operational Efficiency of Your Manufacturing Business

Kenandy Cloud ERP provides all the functionality that is required to help you to increase the operational efficiency of your business:
Manufacturing Models
Kenandy supports multiple manufacturing business models, such as Build to Stock or Build to Order with CPQ. It also allows you to manage your outsourced manufacturing models, such as Supplier to Customer Drop Ship, Consigned Procurement, and Sub Contract Work Order Management

Material Requirements Planning (MRP)
Kenandy MRP processing is both fast and on your schedule, opening up your operations to a realm of new possibilities. Run "what-if" MRPs; determine the product availability for large orders, identify the impact and alternatives for supplier shortages, or shift components to support key customers—any time you need. And because of Kenandy's unique data architecture, all your MRP reports run faster than ever before.

Supply Chain Management
Kenandy supply chain cost planning enables you to model and plan your supply chain costs for multiple time horizons and multiple business scenarios. And you get complete traceability of every component and every item throughout your entire supply chain.

Inventory & Warehouse Management

Kenandy Cloud ERP provides advanced inventory and warehouse management for your manufacturing business. Use attribute-based inventory management to track your inventory on hand—by item, dimension, lot, serial number, and other product attributes. Utilize rule-based inventory management to gain control over the movement of your stock by setting the priority and selecting the precise locations for picking items, and for putting items away.

With Kenandy Cloud ERP you can control your warehouse floor management and fulfill more orders faster by defining attributes in advance—you can even specify your own. This gives you the flexibility to track and manage your inventory by item grade, color, size, or any other characteristic unique to your business or products. Your logistics team members only has to enter a quantity and log the transaction—which makes most of your day-to-day operations almost touchless.

Trade Promotions Management

Kenandy Cloud ERP provides complete visibility across your internal and supply chain networks, enabling you to accurately target, forecast, plan, and execute successful trade promotions. You can easily plan, execute and assess promotion effectiveness, all from within Kenandy's trade promotion management solution. Measure your promotion response rates, and leverage past programs to create accurate and profitable future trade promotions. Create planning workflows and manage promotions as they move through their lifecycles, from initial planning, to customer committed, and finally executed and paid.

Financial Management

With Kenandy, manufacturing and accounting share the same system. There are no messy or costly integrations between systems, and no more complex and error-prone data transfers to and from spreadsheets. You can run accounting and generate financial statements directly from Kenandy —without having to go through the complex and error-prone process of assembling, re-formatting, and exporting product data.

Kenandy Cloud ERP includes all the core capabilities that you need to easily handle your key financial process, such as Accounts Receivable, Accounts Payable, General Ledger, Fixed Assets, Banking. From recording a simple transaction to automatically reconciling accounts—Kenandy makes managing your numbers easier.

Kenandy

Increase Your Agility and Flexibility

In today's business environment, it is crucial that your operations are agile and flexible, so that you can easily modify your business processes to take advantage of new business opportunities. Kenandy's unique data architecture and the native development on the Salesforce platform enable you to increase the agility and flexibility of your manufacturing business.

Business Ready Objects™ Architecture

Business Ready Objects is a new, innovative data architecture developed by Kenandy to enable flexibility in designing business processes. Different from legacy ERP, Business Ready Objects do not require complex code and convoluted data transfers among tens of thousands of database tables to define business processes. Instead, Business Ready Objects encapsulate complete business activities as objects, with objects assembled together to define business processes. Business Ready Objects make it extremely easy to support new business processes, which gives manufacturers unprecedented agility and flexibility.

Built on the Salesforce Platform

Cloud based ERP solutions have been reported as producing a 5-times higher ROI compared to on-premise solutions; and Kenandy is natively developed on the leading platform for these solutions—the Salesforce Platform. This means Kenandy can deliver new features and functionality to you faster. The Salesforce platform makes it exceptionally easy to extend functionality by allowing for "clicks and not code", and is highly scalable to meet any changes in your business.

Solution Highlights

Now you can manage your manufacturing operations with Kenandy Cloud ERP.

- Shop floor control
- Capacity planning
- Production planning and scheduling
- Material Requirements Planning (MRP)
- Material picking and kit management
- Product data management and BOM's
- Formulas, recipes, and routings
- Location and Lot control
- Reservations and allocations
- Mobility and real-time data
- Complete financial management
